Leading Innovation, Creating Tomorrow

Variable Frequency Drive / Inverter **Starvert iC5**

0.4 - 2.2kW 1 phase 200 - 230Volts

Automation Equipment

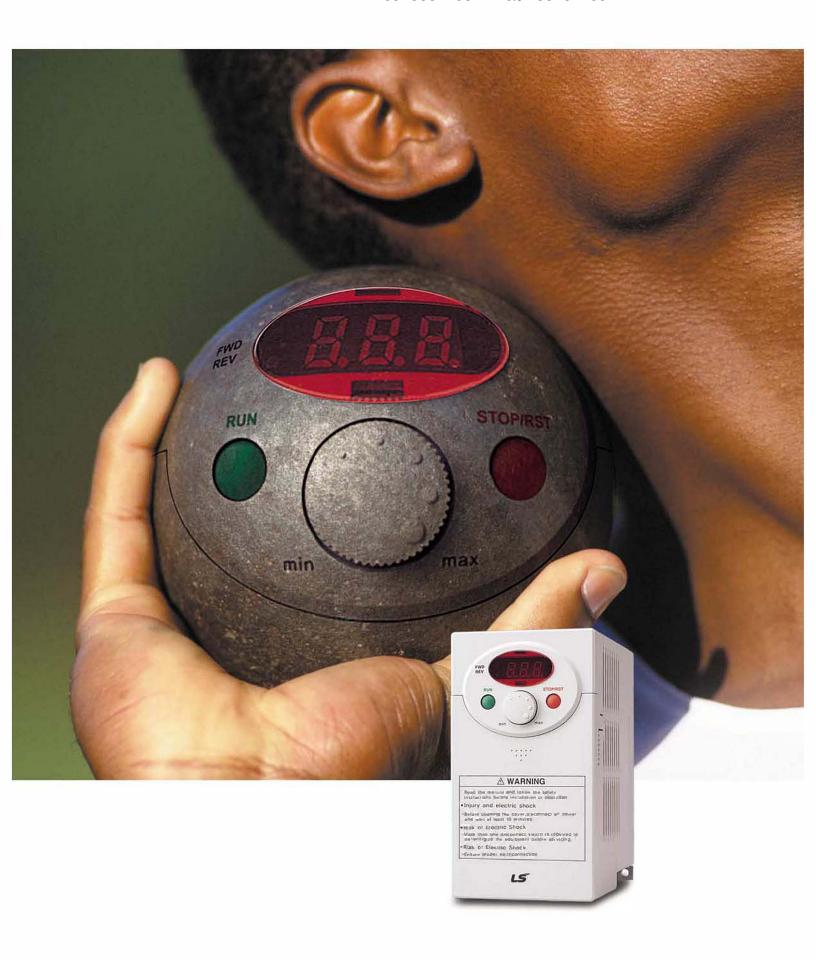

WWWW.LSKALA.COM 09106611367 021-88464139

"Global standard iC5, serves a wide variety of applications to meet the majority of user needs."

- Modbus communication (Option)
- PID control
- Sensorless vector control
- Motor parameter auto tuning

LS Inverter iC5 Series

Sensorless vector control

The iC5 adopts sensorless vector control algorithm, and it improves not only the torque control characteristics, but the speed controlability in an uncertain condition caused by the load variation as well.

Auto tuning

The auto tuning algorithm in the iC5 sets the motor factors automatically that brings the traditional commissioning difficulties mainly in low speed by the load variation and the low torque generation to a settlement.

- Difficulty of measuring the motor constant Input errors by an user
- Low torque in low speed Low speed by the load variation Setup by an expert

characteristic

- Setup by an user Improving torque in low speed
- Auto tuning of the motor characteristics Optimized motor control

PNP and NPN switchable dual signals

The iC5 provides PNP and NPN signals for outside controllers. It works with 24Vdc regardless of the type of PLC or control signals.

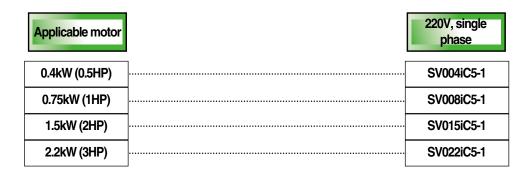

Communication interface, ModBus-RTU

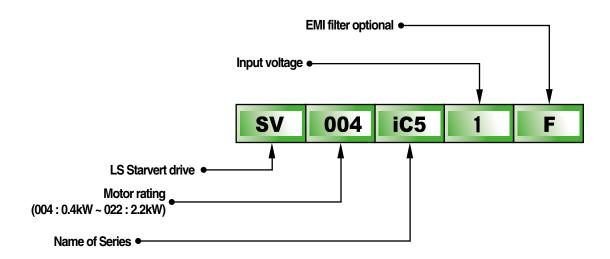

The iC5 provides the most popular communication interface, ModBus-RTU for remote control by PLC or other devices.

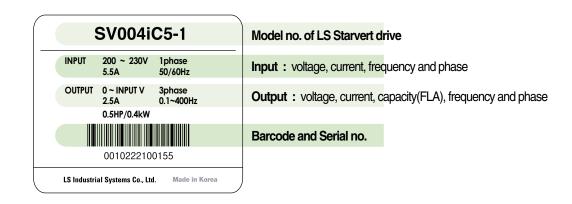

Programmable PID process control

PID process control is used in iC5 to make speed corrections quickly with a minimal amount of overshoot and oscillation for the control of flow, temperature, pressure and etc.

■ Specifications (200-230V class)

Mod	del	SV004iC5-1	SV008iC5-1	SV015iC5-1	SV022iC5-1
Motor rating	[HP]	0.5	1	2	3
	[kW]	0.4	0.75	1.5	2.2
Output ratings	Capacity[kVA]	0.95	1.9	3	4.5
	FLA[A]	2.5	5	8	12
	Voltage		Three phase	e, 200 to 230V	
	Frequency		0 to 4	400Hz	
Input ratings	Voltage		Single phase,	200 to 230V ($\pm 10\%$)	
	Frequency		50 to 60H	tz (±5%)	

■ Control

Control method	V/F control, Sensorless vector control	
Frequency setting resolution	· Digital reference: 0.01Hz · Analog reference: 0.06Hz/60Hz	
Frequency setting accuracy	· Digital: 0.01% of Maximum output frequency · Analog: 0.1% of Maximum output frequency	
V/F ratio	Linear, Squar pattern, User V/F	
Overload capacity	1 min. at 150%, 30sec. at 200% (with inverse characteristic)	
Torque boost	Manual (0 to 15% adjustable), Auto	

■ Operation

Input signal	Operator control	Keypad / Terminal / Communica	ations			
	Frequency setting	Analog:0~10V/4~20mA	Digital: Keypad	· Communication: RS485		
	Start signal	Forward / Reverse				
	Multi-step	Setting up to 8 speeds (use multi-function terminal)				
	Multi-step accel	0.1~6000 sec. Max. 8 types available by multi-function terminal				
	/decel time	Selectable accel/decel patterns: Linear, U and S				
	Emergency stop	Interrupting the output of the drive				
	Jog	Jog operation				
	Fault reset	Reset the fault when protective f	unction is active			
Output signal	Operation status &	Frequency detection, Overload	alarm, Stalling, Overvoltage, I	Undervoltage,		
	Fault output	Drive overheating, Run, Stop, Constant speed, Speed searching,				
		Fault output (Relay and Open collector output)				
	Indicator	Choose one from output frequency, current, voltage and DC voltage.(Output voltage: $0\sim10V$)				
Operation		DC braking, Frequency limit, Frequency jump, Second function,				
function		Slip compensation, Reversing prevention, Auto restart, PID control				

■ Protection functions

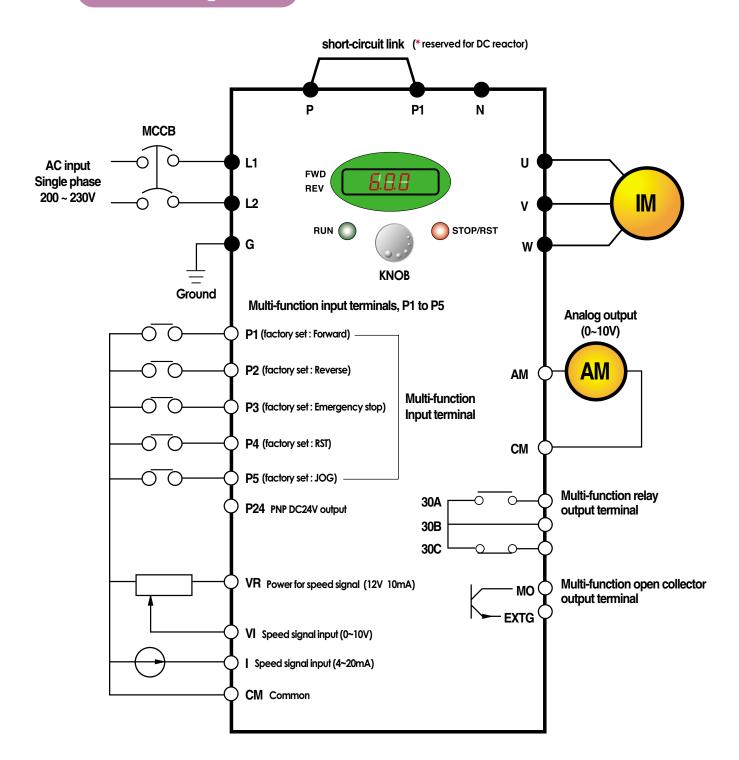

Drive trip	Overvoltage, Undervoltage, Overcurrent, Drive overtemperature, Motor overtemperature, I/O phase loss, I/O mis-wiring,
	Overload , External device fault 1.2, Loss of speed command, Hardware fault, Communication error, CPU error
Drive alarm	Stall prevention, Overload alarm
Momentary	• Less than 15 msec: keeping operation
power less	More than 15 msec : auto restart available

■ Display keypad

Operation information	Output frequency, current and voltage, Set frequency value, Operation speed, DC voltage
Trip information	Display the trip cause when the protection function activates. Recent 5 faults records stored

■ Environment

Operating ambient temp.	-10°C ~50°C
Storage temperature	-20°C ~ 65°C
Humidity	90%Rh max.(non condensing)
Altitude & Vibration	1000m max, 5.9m/sec²(0.6g) max.
Atmosphere	No corrosive gas, flammable gas, oil mist or dust
Pressure	70~106k Pa

Note: 1. ● = Main circuit terminal ○ = Control circuit terminal

2. Analog output voltage is adjustable upto 12V.

3. Speed command can be set by Voltage, Current, Voltage+Current, Keypad, Keypad knob+Voltage, and Keypad knob+current.

Terminal configuration

L1 L2 P P1 N U V W G

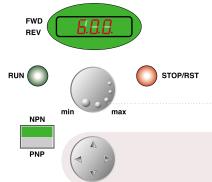

Terminal	Signal	Description
L1, L2	AC line input	Single phase AC line input
U, V, W	Drive output	3 phase output terminals to motor
P, P1	DC reactor	Connecting DC reactor
G	Ground	Chassis ground

30A 30B 30C MO EXTG P24 P1 P2 CM P3

Termir	nal	Signal	Description
Input	P1, P2	Multi-function input	Used for multi-function input. Factory default settings are as follows. P1 = FX, Forward
	P3, P4, P5		P2=RX, Reverse P3=BX, Emergency stop P4=RST, Fault reset P5=JOG, Jog Operation Command
	P24	PNP DC24V output	DC24V power supply in case of PNP mode
	VR	Frequency setting power	Power for Analog frequency setting, Maximum output is +12V 10mA
	VI	Frequency setting(Voltage)	Input DC 0 to 10V to set frequency. Input resistance is 20k $oldsymbol{arrho}$
	1	Frequency setting(Current)	Input DC 4 to 20mA to set frequency. Input resistance is 250 $m{arrho}$
	CM	Common	Common terminal for the analog frequency setting signal and the FM(for monitoring)
Output	AM-CM	For monitoring	Output one out of Output frequency, Output current, Output voltage and DC voltage.
			Factory default set is to Output frequency.
			Maximum output voltage = 0 to 12V, output current = 10mA
	330A, 30C	Multi-function relay and	To interrupt the output when the protection function activates
	30B	Open collector output	or output multi-function signal.
	MO-EXTG	Teminal	Multi-function relay terminal : Max. AC250V/1A, DC30V/1A
			Open collector output terminal : Max. DC24V 50mA

Keypad

Key	Function	Description
RUN	Run key	To operate the drive
STOP/RESET	Stop/Reset key	To stop operating or reset in case of fault
•	Program/Enter	To change parameters and save them
KNOB(Volume)	Frequency	To change the frequency
NPN/PNP	Selection	Mode selection between NPN and PNP
A	Up	To increase the parameter values
▼	Down	To decrease the parameter values
◀	Left	To move the cursor left
	Right	To move the cursor right

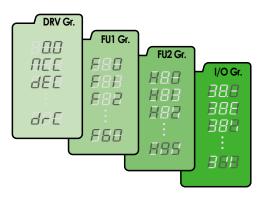

■ Parameter group

There are 4 parameter groups to set parameters properly for the operation.

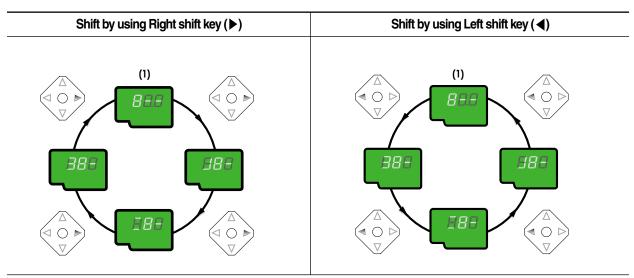

Group	Description
Drive group	Basic parameters such as Command frequency, Accel/Decel time, etc.
Function 1 group	Basic functional parameters such as Max. frequency, Torque boost, etc.
Function 2 group	Application parameters such as Frequency jump, Max./Min. of limit of frequency, etc.
Input/Output group	Parameters to construct the sequence such as Multi-function terminal setting, Auto operation, etc.

■ Parameter group navigation

Drive group	Basic operation parameters such as Command frequency,
	Accel/Decel time, etc.
Function 1 group	Basic functional parameters for adjusting Output frequency,
	Voltage, etc.
Function 2 group	Application parameters of PID operation, The 2nd motor
	setting, etc.
Input/Output group	Parameters to construct the sequence such as Multi-function
	terminal setting, etc

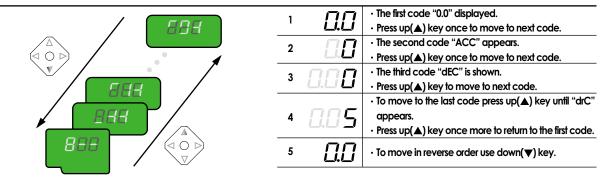

• Shifting between groups is possible only in the first code of each group.

(1) The value of the Command frequency will be displayed in the first code of the Drive group. It will show the value set by the operator. The factory set value is 0.0.

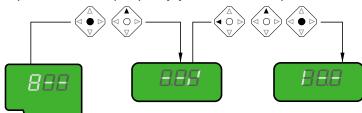

■ Parameter navigation in Drive group

WWWW.LSKALA.COM

■ Procedure to set command frequency in Drive group

To input new command frequency 30.05[Hz] from 0.0 set in the factory

1	ПП	• The first code "0.0" displayed.
•	<u> </u>	· Press pro/ent(●) key.
2		The digit of the first decimal place can be changed.
	டட்	· Press right (▶) key.
3		The digit of the second decimal place can be changed.
3		· Press up(▲) key until the digit becomes 5.
4	0.05	· Press left(◀) key.
	0.05	· The left digit can be set.
		· Press leff(◀) key.
6	0.05	· Press leff(◀) key.
7		Though 00.0 is displayed, the actual value remains at 0.05.
′		· Make 3 by pressing up(▲) key.
	30.0	· Press pro/ent(●) key.
8		· 30.0 is flickering.
		 Press pro/ent(●) key to stop the flickering.
9	30.0	Command frequency 30.0 is stored.

Note: (1) The LCD on the keypad of Drive iC5 displays only 3 digits. Use the shift keys (\blacktriangleleft) to monitor and set the parameters.

> (2) To cancel the parameter setting press the shift keys (\blacktriangleleft or \blacktriangleright) while 30.0 is flickering in the procedure no. 8.

Drive group	Keypad display	Description	Setting range	Factory default	Adjustable during run

Warning:

If protection function activates due to error/fault in the inverter, corresponding alarm is displayed on the keypad as shown below.

Correct the error/fault before restarting or it may decrease the inverter's life expectancy.

Display	Fault/Error	Description
888	Overcurrent	Output current has been greater than 200% of the rated current. The inverter output is interrupted.
888	Ground fault	Ground fault has been occurred at the load side of the inverter. The inverter output is interrupted.
888	Inverter overload	Output current greater than 150% of the rated current has been flowed over 1 min. The inverter output is interrupted.
088	Overload trip	Output current has been greater than the set value (F57) of the rated current. The inverter output is interrupted.
OHE	Coolingpin overheat	Cooling pin has been overheated due to high ambient temperature. The inverter output is interrupted.
888	DC link condenser overload	If the DC condenser of Inverter is in need of replacement the inverter output is interrupted.
888	Output phase loss	One or more of output line U, V and W lost. The inverter output is interrupted.
888	Overvoltage	The inverter main voltage has been risen above the permissible limit 400V. Check if deceleration time has been set too short or line input voltage is too high.
888	Undervoltage	The inverter output is interrupted.
888	Electronic thermal	The inverter output is interrupted according to the set time-inverse curve to prevent the overtemperature of the motor due to overloads.
888	Parameter store error	Error has been occurred on the storing of the changed parameters. It is displayed when power is on.
898	Hardware error	It is displayed in case of software error. It is not possible to reset by STOP/RST key on the keypad or reset terminals. Open the inverter power and make sure the keypad power is off and close the power again.
E 88	Communication error	Communication error between controller and keypad. It is not possible to reset by STOP/RST key on the keypad or reset terminals. Open the inverter power and make sure the keypad power is off and close the power again.
888	Coolingfan error	Error has been occurred on the coolingfan.
888	Output instant interrupting	The inverter output is interrupted in the case that BX terminal is ON. Warning: To restart the drive make BX terminal OFF during the FX /RX is ON.
888	A contact fault signal input	If $120/21/22/23/24$ set to 18 is ON, the inverter output is interrupted.
588	B contact fault signal input	If 120/21/22/23/24 set to 19 is ON, the inverter output is interrupted.
888	Frequency command loss	If signal input is failed for the driving by using analog input or option (RS485), try to drive according to the setting at 162 .

WWWW.LSKALA.COM	09106611367	021-88464139

	WWW.L.	SKALA.COM 09106611367 02.
Fault/Error	Possibsle cause	Solution
BEB Overcurrent	Accel/Decel time is not enough for the load inertia (GD²) Increase the Accel/Decel time The load is greater than the rating of the inverter. Inverter output is assigned during the free run of the motor. The motor brake operates too fast.	 Replace the inverter with a higher rating Operate after the motor stops or use speed search (H22) in FU2 in the output terminals. Verify the output witing Verify the mechanical brake.
688 Ground fault	 Ground fault at the load side of the inverter. Insulation of the motor is broken. 	▶ Check to see if there is something wrong with output wiring. ▶ Replace a motor.
II () () Inverter overload II E Overload trip	 The load is greater than the rating of the inverter. Power rating is set to the lower value than the load Torque boost is too great. 	 Increase the ratings of a motor and an inverter. Check to see if the setting is correct. Reduce the torque boost.
######################################	 Fault in the cooling system. The cooling fan is used beyond the life expectancy. High ambient temperature 	 ▶ Check to see if there is any alien substance in the ventilation system. ▶ Replace the cooling fan. ▶ Keep the ambient temperature below 40°
PBE Output phase loss	Fault in the load side contactor Wiring problem	▶ Replace the contactor.▶ Verify the output wiring
ERB Coolingfan error	 Alien substances are in the ventilator. The cooling fan is used beyond the expectancy. 	 Check to see if there is any alien substance in the ventilation system. Replace the cooling fan.
GBE Overvoltage	 Decel time is not enough for the load inertia(GD°) There is a survived load in the load side. Higher voltage than rating is supplied. 	 Increase the Decel time Uase DB unit. Verify the power voltage.
<i>EBE</i> Undervoltage	 Lower voltage than rating is supplied. Power capacity is not enough for the additional loads like welders and direct-on-line starting motors. Fault in the line side contactor 	 Verify the power voltage. Increase the power capacity. Replace the contactor.
EEH Electronic thermal	 Overtemperature of the motor The load is greater than the rating of the inverter. Electronic thermal level is set lower than rating. Inverter power rating is set to the lower value than the load Long operation at low speed. 	 Reduce the load or operation times. Increase the ratings of the inverter. Adjust the electronic thermal property. Adjust the inverter rating property. Replace the motor with the separated power cable for the cooling fan.
SER A contact fault signal input SEB B contact fault signal input	● The terminal I20/21/22/23/24 set to 18/19 is ON	Verify the circuits connected to the external fault terminals.
Frequency command loss	Frequency command loss at terminals V1 and I	Verify the wiring connected to V1 and I terminals.
Parameter store error HUE Output instant interrupting EBB Communication error	Refer to LS or distributors	

Warning:

Carefully read the instruction for installation and wiring of inverters and relevant devices. Normal operation is impossible in case of the improper system design and wiring. These can shorten the life of the inverter and damage it at the worst.

INDUCTORS FOR VARIABLE SPEED DRIVES

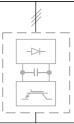

The inductors manufactured with special magneticcores are advisable for location: BETWEEN MAINS AND VARIABLE SPEED DRIVE, in order to protect the equipment from overvoltages, voltage surges and also to limit the line current and the harmonics generated by VSD. BETWEEN VARIBLE SPEED DRIVE AND MOTOR, to absorb the voltage peaks in the motor terminals, when the connection cables are long or there are more than one motor in parallel, for having a better efficiency and to eliminate the humming noise of the motor.

The family of filters manufactured by LIFASA has been specially developed and approved for its application with variable speed drives, to assure the compliance of the EMC (Electro Magnetic Compatibility) and the LV safety European Directives, in both industrial and domestic environments.

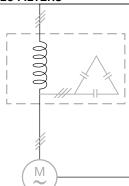

VARIABLE SPEED DRIVES

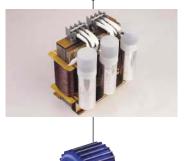

- Powers from 0.37 to 375 kW
- Sngle/three phase voltages 220/230 Vac
- Three phase voltages 380/460 Vac
- Sensorless vector control, V/F closed loop
- Removable console with copy function
- RS485 communication facilities as standard
- Autotuning
- Special parameters for special applications

OUTPUT LC FILTERS

The commutation of the IGBT's at high frequency (PWM) provokes an output voltage with peaks up to 1300 V The LC filter - low pass - reduce the dV/dt converting the voltage in a sinus waveform, eliminating all the isolation problems in the motor and the emission of interference from the cables.

* Filter for use of LS Inverters :
